# PySMA

**Johann Kellerman, René Klomp**

**Oct 18, 2021**

**CONTENTS:**

<b>1</b>	<b>Getting Started</b>	<b>1</b>
<b>2</b>	<b>PySMA Main Class</b>	<b>3</b>
<b>3</b>	<b>Submodules</b>	<b>5</b>
<b>4</b>	<b>Indices and tables</b>	<b>17</b>
	<b>Python Module Index</b>	<b>19</b>
	<b>Index</b>	<b>21</b>

## GETTING STARTED

### 1.1 Install

PySMA is available on [pypi](#) and can be installed using `pip`.

```
pip install pysma
```

### 1.2 Create SMA instance

The `SMA` class requires a `ClientSession` object, an URL and a password. The default user group is “user”, but can be changed by passing it as the fourth group parameter.

```
session = aiohttp.ClientSession(connector=aiohttp.TCPConnector(ssl=False))
url = "https://device-hostname"
password = "MyPassword!"

sma = pysma.SMA(session, url, password)
```

### 1.3 Create Sensors

To retrieve values from the device you need a `Sensors` object. The easiest way is to generate one using the `get_sensors()` method. This will query the device to figure out the device class and returns a `Sensors` object containing specific `Sensor` objects for your device.

```
sma_sensors = sma.get_sensors()
```

Alternatively this can be manually created by initializing an empty `Sensors` object and adding new `Sensor` objects to it using the `add()` method. Predefined sensors can be found in `pysma.definitions`. See also `definitions.py` at [Github](#).

```
sma_sensors = Sensors()
my_sensor = Sensor("6300_12345678_0", "dummy_sensor") # This key won't work!
sma_sensors.add(my_sensor)
sma_sensors.add(pysma.definitions.pv_power_a)
```

## 1.4 Read Sensor values

Now you have a *Sensors* object, you can pass this to *read()* to read the values from the device. The retrieved values are stored in the respective *Sensor*.

```
sma.read(sma_sensors)

for sma_sensor in sma_sensors:
    print(f"{sma_sensor.name}: {sma_sensor.value}")
```

## 1.5 Complete Example

A full example can be found in the [Github repository](#)

## PYSMA MAIN CLASS

SMA WebConnect library for Python.

See: <http://www.sma.de/en/products/monitoring-control/webconnect.html>

Source: <http://www.github.com/kellerza/pysma>

```
class pysma.SMA(session: aiohttp.client.ClientSession, url: str, password: Optional[str] = None, group: str =  
                'user', uid: Optional[str] = None)
```

Bases: object

Class to connect to the SMA webconnect module and read parameters.

Init SMA connection.

### Parameters

- **session** (*ClientSession*) – aiohttp client session
- **url** (*str*) – Url or IP address of device
- **password** (*str*, *optional*) – Password to use during login. Defaults to None.
- **group** (*str*, *optional*) – Username to use during login. Defaults to “user”.
- **uid** (*str*, *optional*) – uid used for data extraction. Defaults to None.

**Raises** **KeyError** – User was not in USERS

**async** **close\_session()** → None

Close the session login.

**async** **device\_info()** → dict

Read device info and return the results.

**Returns** dict containing serial, name, type, manufacturer and sw\_version

**Return type** dict

**async** **get\_devclass**(*result\_body: Optional[dict] = None*) → Optional[str]

Get the device class.

**Parameters** **result\_body** (*dict*, *optional*) – result body to extract device class from. Defaults to None.

**Raises** **KeyError** – More than 1 device class key is not supported

**Returns** The device class identifier, or None if no identifier was found

**Return type** str

**async** **get\_sensors()** → *pysma.sensor.Sensors*

Get the sensors based on the device class.

**Returns** Sensors object containing Sensor objects

**Return type** *Sensors*

**async new\_session()** → bool

Establish a new session.

**Raises** *SmaAuthenticationException* – Authentication failed

**Returns** authentication successful

**Return type** bool

**async read(sensors: pysma.sensor.Sensors)** → bool

Read a set of keys.

**Parameters** **sensors** (*Sensors*) – Sensors object containing Sensor objects to read

**Returns** reading was successful

**Return type** bool

**async read\_dash\_logger()** → dict

Read the dash loggers.

**Returns** Dictionary containing loggers returned by device.

**Return type** dict

**async read\_logger(log\_id: int, start: int, end: int)** → list

Read a logging key and return the results.

**Parameters**

- **log\_id** (*int*) – The ID of the log to read. totWhOut5min: 28672 totWhOutDaily: 28704 GridMsTotWhOutDaily: 28752 GridMsTotWhInDaily: 28768 ObjLogBatCha: 28816 totWhIn5min: 28736 totWhInDaily: 28768 ObjLogBatChrg: 29344 ObjLogBatDschr: 29360
- **start** (*int*) – Start timestamp in seconds.
- **end** (*int*) – End timestamp in seconds.

**Returns** The log entries returned by the device

**Return type** list

## SUBMODULES

### 3.1 pysma.const module

Constants for SMA WebConnect library for Python.

### 3.2 pysma.definitions module

Sensor definitions for SMA WebConnect library for Python.

```
pysma.definitions.battery_capacity_a = Sensor(key='6100_00499100',  
name='battery_capacity_a', unit='%', factor=None, path=None, enabled=False,  
l10n_translate=False, value=None)
```

Capacity battery A

```
pysma.definitions.battery_capacity_b = Sensor(key='6100_00499100',  
name='battery_capacity_b', unit='%', factor=None, path=None, enabled=False,  
l10n_translate=False, value=None)
```

Capacity battery B

```
pysma.definitions.battery_capacity_c = Sensor(key='6100_00499100',  
name='battery_capacity_c', unit='%', factor=None, path=None, enabled=False,  
l10n_translate=False, value=None)
```

Capacity battery C

```
pysma.definitions.battery_capacity_total = Sensor(key='6100_00696E00',  
name='battery_capacity_total', unit='%', factor=None, path=None, enabled=True,  
l10n_translate=False, value=None)
```

Total battery capacity

```
pysma.definitions.battery_charge_a = Sensor(key='6400_00499500', name='battery_charge_a',  
unit='kWh', factor=1000, path=None, enabled=False, l10n_translate=False, value=None)
```

Charge battery A

```
pysma.definitions.battery_charge_b = Sensor(key='6400_00499500', name='battery_charge_b',  
unit='kWh', factor=1000, path=None, enabled=False, l10n_translate=False, value=None)
```

Charge battery B

```
pysma.definitions.battery_charge_c = Sensor(key='6400_00499500', name='battery_charge_c',  
unit='kWh', factor=1000, path=None, enabled=False, l10n_translate=False, value=None)
```

Charge battery C

```
pysma.definitions.battery_charge_total = Sensor(key='6400_00496700',
name='battery_charge_total', unit='kWh', factor=1000, path=None, enabled=True,
l10n_translate=False, value=None)
    Total charge

pysma.definitions.battery_charging_voltage_a = Sensor(key='6102_00493500',
name='battery_charging_voltage_a', unit='V', factor=100, path=None, enabled=False,
l10n_translate=False, value=None)
    Charging voltage battery A

pysma.definitions.battery_charging_voltage_b = Sensor(key='6102_00493500',
name='battery_charging_voltage_b', unit='V', factor=100, path=None, enabled=False,
l10n_translate=False, value=None)
    Charging voltage battery B

pysma.definitions.battery_charging_voltage_c = Sensor(key='6102_00493500',
name='battery_charging_voltage_c', unit='V', factor=100, path=None, enabled=False,
l10n_translate=False, value=None)
    Charging voltage battery C

pysma.definitions.battery_current_a = Sensor(key='6100_40495D00',
name='battery_current_a', unit='A', factor=1000, path=None, enabled=True,
l10n_translate=False, value=None)
    Current battery A

pysma.definitions.battery_current_b = Sensor(key='6100_40495D00',
name='battery_current_b', unit='A', factor=1000, path=None, enabled=True,
l10n_translate=False, value=None)
    Current battery B

pysma.definitions.battery_current_c = Sensor(key='6100_40495D00',
name='battery_current_c', unit='A', factor=1000, path=None, enabled=True,
l10n_translate=False, value=None)
    Current battery C

pysma.definitions.battery_discharge_a = Sensor(key='6400_00499600',
name='battery_discharge_a', unit='kWh', factor=1000, path=None, enabled=False,
l10n_translate=False, value=None)
    Discharge battery A

pysma.definitions.battery_discharge_b = Sensor(key='6400_00499600',
name='battery_discharge_b', unit='kWh', factor=1000, path=None, enabled=False,
l10n_translate=False, value=None)
    Discharge battery B

pysma.definitions.battery_discharge_c = Sensor(key='6400_00499600',
name='battery_discharge_c', unit='kWh', factor=1000, path=None, enabled=False,
l10n_translate=False, value=None)
    Discharge battery C

pysma.definitions.battery_discharge_total = Sensor(key='6400_00496800',
name='battery_discharge_total', unit='kWh', factor=1000, path=None, enabled=True,
l10n_translate=False, value=None)
    Total discharge

pysma.definitions.battery_power_charge_a = Sensor(key='6100_00499300',
name='battery_power_charge_a', unit='W', factor=None, path=None, enabled=False,
l10n_translate=False, value=None)
    Charging power battery A
```

```

pysma.definitions.battery_power_charge_b = Sensor(key='6100_00499300',
name='battery_power_charge_b', unit='W', factor=None, path=None, enabled=False,
l10n_translate=False, value=None)
    Charging power battery B

```

Voltage for phase 3

### 3.3 pysma.exceptions module

Exceptions for the pysma library.

**exception** `pysma.exceptions.SmaAuthenticationException`

Bases: `pysma.exceptions.SmaException`

An attempt to authenticate failed.

**exception** `pysma.exceptions.SmaConnectionException`

Bases: `pysma.exceptions.SmaException`

An error occurred in the connection with the device.

**exception** `pysma.exceptions.SmaException`

Bases: `Exception`

Base exception of the pysma library.

**exception** `pysma.exceptions.SmaReadException`

Bases: `pysma.exceptions.SmaException`

Reading the data did not return an expected result.

## 3.4 pysma.helpers module

Helper functions for the pysma library.

`pysma.helpers.version_int_to_string(version_integer: int) → str`

Convert a version integer to a readable string.

**Parameters** `version_integer (int)` – The version integer, as retrieved from the device.

**Returns** The version translated to a readable string.

**Return type** `str`

## 3.5 pysma.sensor module

Sensor classes for SMA WebConnect library for Python.

**class** `pysma.sensor.Sensor`(*key: str, name: str, unit: str = "", factor: Optional[int] = None, path: Optional[Union[list, tuple]] = None, enabled: bool = True, l10n\_translate: bool = False*)

Bases: `object`

pysma sensor.

Method generated by attrs for class Sensor.

**enabled**

**extract\_value**(*result\_body: dict, l10n: Optional[dict] = None, devclass: str = 'I'*) → `bool`

Extract value from json body.

**Parameters**

- **result\_body** (*dict*) – json body retrieved from device
- **l10n** (*dict, optional*) – Dictionary to translate tags to strings. Defaults to `None`.
- **devclass** (*str, optional*) – The device class of the device used to extract the value. Defaults to `"I"`.

**Returns** Extracting value successful

**Return type** `bool`

**factor**

**key**

**key\_idx**

`l10n_translate`

`name`

`path`

`unit`

`value`

```
class pysma.sensor.Sensors(sensors: Optional[Union[pysma.sensor.Sensor, List[pysma.sensor.Sensor]]] =  
                           None)
```

Bases: object

SMA Sensors.

Init Sensors.

**Parameters** `sensors` (`Union[Sensor, List[Sensor], None]`, *optional*) – One or a list of sensors to add on init. Defaults to None.

**add**(*sensor*: `Union[pysma.sensor.Sensor, List[pysma.sensor.Sensor]]`) → None

Add a sensor, logs warning if it exists.

A copy of sensor, or the sensors in the list, will be added. If the sensor name already exists it will be overwritten. If the sensor key already exists it will not be added.

**Parameters** `sensor` (`Sensor, List[Sensor]`) – One or a list of sensors to add

**Raises** `TypeError` – Argument sensor does not match an expected type
